

# Quo vadis, Prometheus?

## Monitoring at scale

Richard Hartmann,

richard.hartmann@space.net

2017-11-15

# ‘whoami’

- System architect at SpaceNet
- FOSDEM, DebConf, DENOGx, PromCon staff
- Author of <https://github.com/RichiH/vcsh>
- Debian Developer
- Prometheus team member
- Currently responsible for building one of the most modern datacenters in Europe
- ...and always looking for nice co-workers in the Munich area

Do we even need this section?

## Show of hands

- Who has heard of Prometheus?
- Who is considering to use Prometheus?
- Who is POCing Prometheus?
- Who uses Prometheus in production?

Do we even need this section?

# Prometheus 101

- Inspired by Google's Borgmon
- Time series database
- float64 timestamp, float64 value
- Instrumentation & exporters
- Not for event logging
- Dashboarding via Grafana

Do we even need this section?

## Main selling points

- Highly dynamic, built-in service discovery
- No hierarchical model, n-dimensional label set
- PromQL: for processing, graphing, alerting, and export
- Simple operation
- Highly efficient

Do we even need this section?

## Cloudy with a chance of buzzwords

- So it's built with highly dynamic environments in mind
  - Containers, sidecars, microservices, ALL the cloud
  - But it's a monolithic application
- 
- ...why?

Do we even need this section?

# Resilience, resilience, and also resilience

- What do you need for operations?
- Power and cooling
- Network connectivity
- Monitoring
- The rest you can fix

# All new and shiny 2.0

- Released on 2017-11-08
  - (Yes, I did suggest we release today along with this talk)
- Various cleanups and improvements
- See <https://github.com/prometheus/prometheus/releases>

# Three main features

- Storage backend
  - Caveat: Prometheus 2.0 comes with storage v3
- Staleness handling
- Remote read & write API is now stable
- Links to in-depth talks about these features are at the end of these slides

# Prometheus 1.x

- We used to have one file per time series
- Easy to implement
  - Look up label set
  - Map files directly to RAM
  - Let the OS figure out caching etc
  - Use data
- Why change?

# Churn

- Churn was becoming more and more of a problem
- There's a company with a 15 minute maximum lifetime for their containers
- If you have a lot of files which might contain data for any given time frame, you need to look at all of them

# Storage v3

- Fabian Reinartz had an idea about new storage
- This POC turned out to be so good, we decided to cut a major release for it
- How does it work?

# One file per series

# Selection

# Blocks

# Test setup

- Kubernetes cluster with dedicated Prometheus nodes
- 800 microservice instances and Kubernetes components
- 120k samples/sec
- 300k active time series
- Swap out 50% of all pods every 10 minutes

# Results

- 15x reduction in memory usage
- 6x reduction in CPU usage
- 80-100x reduction in disk writes
- 5x reduction in on-disk size
- 4x reduction in query latency on expensive queries

# One more thing...

Also, you can now properly snapshot and backup Prometheus.

## Downside of handling churn

- So now we can handle extreme churn
- ...and suddenly, five minutes staleness timeouts seem awfully long
  - Down alerts continue to fire
  - Double counting
  - Other icky corner cases
- ...and what if you need more than five minutes scrape interval?

# Results

- When a target goes away, its time series are considered stale
- When a target no longer returns a time series, it is considered stale
- Longer eval/scrape intervals are now easier to handle

# The way there

- The actual technical background is too complex for this talk
- Find recording and slides by Brian Brazil at the end of this talk

# Playing nicely with others

- We now have a stable remote read/write API
- Which we're already using ourselves; it's the recommended upgrade path from 1.x
- You need to upgrade to 1.8.2 to get the correct version in 1.x

## Downsides..

# So, about backfill and explicit timestamps...

- If explicit timestamps were icky before, this has now become worse
- You can not ingest data older than the age of the current storage block, nor data much newer
- Staleness vs timestamps is non-trivial

# ACID databases...

- Availability - we have that
- Consistency - we have that
- Isolation - here, there be 2.1 features
- Durability - we have that since 2.0

# Isolation

- Each append action gets a write ID (64 bit monotonic counter)
- Every sample's write ID is noted along with value and timestamp
- Any append action which has not yet committed or rolled back is ignored at query time
- We keep write IDs in memory; if we restart or crash, the atomicity of the write ahead log will protect us

And beyond

# True HA

- So now all our storage is in self-contained blocks
- ...this sounds a lot like objects
- There's a working test implementation which uses local disk as a hot cache
- ...and pulls the rest of that data from S3
- In theory, we could use this to splice data from different Prometheus storages together

And beyond

## Humble aspirations

- When we say that we want to change how the world does monitoring, we mean it
- One of our most powerful features are labels
- Labels are encoded in our exposition format
- Some third-party projects and vendors have an issue with supporting a "competing" project
- Big shout-out to Paul Dix and InfluxData for adopting Prometheus concepts!

And beyond

# OpenMetrics

- We are spinning out Prometheus' exposition format
- It will join CNCF as a full project
- We will submit an ID and try to get an IETF RFC published
- ...so you can sneak this random RFC into the requirements of your next tender ;)

And beyond

## Already on board

- Cloudflare
- GitLab
- Google
- Grafana
- InfluxData
- Kausal.co
- Oath.com / Yahoo / Verizon
- RobustPerception
- SpaceNet
- Uber
- <https://github.com/richih/OpenMetrics>

And beyond

# PromcCon 2018

- Current plan is to do it in Munich or Dublin
- We will continue to run the conference ourselves, but CNCF is handling money for us
- If you want to sponsor a venue, do let us know
- We can only accept a venue if a team member is living nearby and is willing to invest the time

And beyond

## Generally speaking...

- Yes, we want to change the world
- Simple and resilient operation of Prometheus remains a core goal
- More project and software integrations... and we're talking to hardware vendors as well
- Supporting tomorrow's 10x scale today
