Prometheus Deep Dive Monitoring. At scale.

Richard Hartmann & Frederic Branczyk
@TwitchiH & @fredbrancz

2018-12-12

Introduction

Who are we?

Introduction

- Richard "RichiH" Hartmann
 - Swiss army chainsaw at SpaceNet
 - Project lead for building one of the most modern datacenters in Europe
 - Debian Developer
 - FOSDEM, DebConf, DENOGx, PromCon staff
 - Prometheus team member
- Frederic Branczyk
 - Red Hat (previously CoreOS)
 - All things Prometheus / Kubernetes
 - Kubernetes SIG-Instrumentation lead
 - Prometheus team member

Show of hands

- Who has heard of Prometheus?
- Who is considering to use Prometheus?
- Who is POCing Prometheus?
- Who uses Prometheus in production?

Prometheus 101

- Inspired by Google's Borgmon
- Time series database
- int64 timestamp, float64 value
- Ecosystem of instrumentation & exporters
- Not for events
 - Logging
 - Tracing (more on that later)
 - etc.
- Dashboarding via Grafana

Main selling points

- Highly dynamic, built-in service discovery
- No hierarchical model, n-dimensional label set
- PromQL, one language for ALL the things: processing, graphing, alerting, export...
- Simple operation
- Highly efficient

Cloudy with a chance of buzzwords

- So it's built with highly dynamic environments in mind
- It's the second project to ever join CNCF and the de facto standard in cloud-native monitoring
- Kubelets, sidecars, microservices, ALL the cloud-native
- But it's a monolithic application
- ...why?

Resilience, resilience, and also resilience

- What do you need for operations?
 - Power and cooling
 - Network connectivity
 - Observability, a.k.a. Monitoring
- The rest you can fix

Three main features

- Storage backend
 - Caveat: Prometheus 2.0 comes with storage v3
- Staleness handling
- Remote read & write API is now stable-ish.
- Links to in-depth talks about these features are at the end

2.0 to 2.2.1

00 00000 0

Storage

Prometheus 1.x

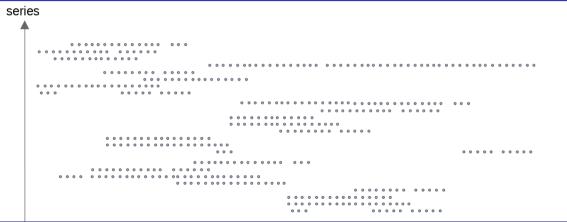

- We used to have one file per time series
- ..and one common index for all of time
- Relatively easy to implement
- Pretty efficient
- Why change?

Churn

- Churn was becoming more and more of a problem
- There's a company with a 15 minute maximum lifetime for their containers
- If you have a lot of files which might contain data for any given time frame, you need to look at all of them

One file per series

Test setup for 2.0 release

- Kubernetes cluster with dedicated Prometheus nodes
- 800 microservice instances and Kubernetes components
- 120k samples/sec
- 300k active time series
- Swap out 50% of all pods every 10 minutes

Results

- 15x reduction in memory usage
- 6x reduction in CPU usage
- 80-100x reduction in disk writes
- 5x reduction in on-disk size
- 4x reduction in query latency on expensive queries
- Want to reproduce? https://github.com/prometheus/prombench

2.4 - 2.6 0 0 000 **Beyond** 00 00000 Outro

Remote read API

Playing nicely with others

- We now have a stable-ish remote read/write API
- Twelve integrations for this API
- Ongoing work to send write-ahead-log over the wire to fill gaps

Stability

Security & quality

- CNCF sponsored external code review by Cure53
- Focussed on security, but this always means looking at stability as well
- Keep in mind that Prometheus willfully ignored most security considerations
- Encryption, authentication, and authorization currently need to be handled via reverse proxies
- We will be changing Prometheus to support security out-of-the-box

Stability

Release stability

- Every single release since 2.0.0 has had issues
- Some bugs and some human mistakes in the release process
- Always running latest is the cloud-native approach, but this is still not acceptable
- ..especially if every single version has its issues
- We put in more checks and balances to ensure cleaner releases going forward
- If there are bugs we can't get rid of, we go into feature moratorium
- 2.3.2 is the first fully stable release in the 2.x train

Release cycle

Fixed release cycle

- Every six weeks, we mark a new RC
- Cycle is relative to previous RC, not previous release
- RC is published and iterated upon as long as there are issues
- Release handling cycles between team members to ensure several people are able to release

PromQL

Quick is not quick enough

- Brian Brazil optimized PromQL
- 5x faster for time vector functions
- 100x reduction in garbage to collect

Long-term storage

Problem statement

- Long-term storage is one of the last remaining major features left untackled
- Fundamentally, Prometheus operates as distinct data islands
- As there's no backfill, data dies along with its instance by default

Long-term storage

Solutions

- Storage v3 supports backups efficiently and effectively
- Remote read-write allows you to integrate with a growing list of projects and products, e.g. Cortex
- On storage level, there are object storage backends for Prometheus, e.g. Thanos
- Remote API can now send WAL over the wire to fill gaps in data
- There are twelve different systems which are able to ingest Proemtheus data this way
- We deliberately do not endorse any particular approach or solution; this might change over time

Long-term storage

Testing

- Unit tests for alerts
- Our goal is to allow end-to-end testing of not only Prometheus as software, but also of any individual deployment

ACID

ACID databases...

- Atomicity since 1.x
- Consistency since 1.x
- Isolation will happen within 2.x
- Durability since 2.0

ACID

Isolation

- Each append action gets a write ID (64 bit monotonic counter)
- Every sample's write ID is noted along with value and timestamp
- Any append action which has not yet been committed, or has been rolled back, is ignored at query time
- We keep write IDs in memory; if we restart or crash, the atomicity of the write ahead log will protect us

Humble aspirations

- When we say that we want to change how the world does monitoring, we mean it
- One of our most powerful features are labels
- Labels are encoded in our exposition format
- Some third-party projects and vendors have an issue with supporting a "competing" project

What do?

- We are spinning out Prometheus' exposition format
- Face-to-face kick-off last August at Google London
- Independent CNCF member project, IETF RFC, test suite, etc
- We are writing code in Prometheus and the Python client library
- https://github.com/OpenObservability/OpenMetrics
- Prometheus 2.5 has experimental OpenMetrics support

Beyond metrics

- OpenMetrics supports more than just metrics
- Every single data point in a time series can point to one single event
- Especially useful if you emit one trace id per histogram bucket
- Some integrations already support this concept, e.g. OpenCensus
- Ingestors are free to discard this optional data, e.g. Prometheus

Bringing observability together

- OpenTracing already on board with this effort
- There will be an observability sidetrack
- Long-term goal is one common, modular, well-engineered standard under a new name

2.0 to 2.2.1 00 0 0000000 0

0 0 000 00000

Bevond

000

OpenMetrics

First committers to adopt, too many to list all

- Cloudflare
- CNCF at large
- GitLab
- Google
- Grafana
- InfluxData
- Kausal.co
- Oath.com / Yahoo / Verizon
- RobustPerception
- SpaceNet
- Uber

Long term promises

Generally speaking...

- Yes, we want to change the world
- Simple and resilient operation of Prometheus remains a core goal
- The path from raw data to reliable alerts is the single most important user contract we have
- More project and software integrations... and we're talking to hardware vendors as well
- Supporting tomorrow's 10x scale today
